

Project Proposal

OutYah

Jamaica Outing Discovery Platform

Week 1 Deliverable (June 29 - July 3, 2026) - Project Planning

Student: Khrisean Stewart

Course: Special Projects

Date: 31 July 2026

Repository: https://github.com/KhriseanStewart/VTDI_Platform

Live app: <https://vtdi-platform.vercel.app>

1. Introduction

OutYah is a web application that helps locals and visitors discover bars, restaurants, nightlife, beaches, attractions, and events across Jamaica. The product combines an image-forward social feed with map discovery, favorites, multi-stop outing planning, and an admin portal for content management.

2. Problem Statement

Travel and outing discovery for Jamaica is fragmented. Users bounce between social media, generic maps, and outdated directories. There is no focused, trustworthy, image-first platform that connects discovery to planning and directions.

3. Objectives

- Deliver a responsive discovery experience (feed + map toggle).
- Support venue detail, favorites, and ordered outing plans with directions.
- Persist content and user data in Supabase with role-based admin management.
- Deploy a working beta to the web (Vercel) with version control on GitHub.

4. Scope

In scope

- Public pages: Feed/Map, Venue Detail, Events, Favorites, Planner, Profile, Auth
- Admin portal: Places, Events, Posts CRUD
- Google Maps pins and multi-stop directions
- Supabase Auth, Postgres schema, RLS, seed/migrations

Out of scope (this course window)

- Native mobile apps
- Live Instagram Graph sync (posts managed in-app/admin)
- Payments / ticket checkout

5. Stakeholders

- End users seeking outings in Jamaica
- Administrators managing venues, events, and posts
- Course instructor / assessor
- Developer: Khrisean Stewart

6. SDLC Approach

The project follows a phased SDLC aligned to the Special Projects schedule: planning, requirements, design, development (prototype then beta), testing, and deployment/presentation.

7. Success Criteria

- Users can browse feed/map, open venues, favorite, and build a plan.
- Admins can authenticate and manage places/events/posts.
- Application is deployed and accessible online.
- Documentation covers proposal through design and progress reporting.
