1. Prototype Objective

Prototype Version 1 demonstrates the complete public discovery journey before the final backend and administration work. It validates navigation, responsive layouts, visual hierarchy, venue discovery, maps, and outing planning using representative content.

2. Core Modules Implemented

- Responsive application shell: desktop sidebar and mobile bottom navigation.
- Home discovery feed with search, category chips, event strip, and Feed/Map switch.
- Venue detail gallery, metadata, reviews, hours, favorites, and plan actions.
- Favorites grid and outing planner with suggested stops.
- Events list and event detail routes.
- Google Maps markers, category differentiation, and directions links.

3. Prototype Navigation Flow

1. Open the home feed and search or choose a category.
2. Switch to Map to discover venues geographically.
3. Open a venue and review its gallery, hours, and location.
4. Favorite the venue or add it to the outing plan.
5. Open the planner and launch Google Maps directions.

4. Interface Refinement

Early versions used heavy card shadows and rounded containers. Prototype feedback led to a flatter, image-led visual language: photos remain rounded, captions sit directly on the page background, and borders replace large shadows. This makes scanning faster and better matches the social discovery concept.

5. Prototype Verification

- Vite production build completed successfully.
- Primary routes were manually exercised on desktop and mobile widths.
- Vercel SPA rewrite was added so deep links no longer return 404.
- Google Maps API was enabled for map, detail, and planner surfaces.

6. Gaps Carried into Week 5

- Replace local/sample catalog dependency with Supabase.
- Add real authentication and user-specific persistence.
- Create role-protected admin content management.
- Improve loading, error, and empty data states.

7. Prototype Access
